Research Interests

Applied cryptography with a focus on secure multi-party computation and zero-knowledge proofs. The design, analysis, and implementation of MPC (e.g., garbled circuits, oblivious transfer, homomorphic encryption, and secret sharing-based protocols) and ZKP protocols (VOLE-based ZK and non-interactive ZK). The building of secure systems by applying cryptography-based privacy-enhancing techniques to various fields, including the database, networking, formal verification, machine learning, health care, and decentralized systems.
